HOGESCHOOL INFORMATION AND COMMUNICATION TECHNOLOGY

DESIGN DOCUMENT

Student:

Vilius Bučinskas

Eindhoven, 2019

TABLE OF CONTETS

1. Introduction 3

1.1. TOPIC 3

1.2. GOAL OF THE PROJECT 3

1.3. SCOPE AND CONSTRAINtS 3

2. USER STUDY 3

2.1. TARGETED USERS 3

3. UX/UI study 3

3.1. Research 3

3.1.1. Mobile UX Design key principles 3

3.1.2. mobile ui design key princiles 4

4. CYCLE 5

4.1. STRUCTURAL DESIGN 5

4.1.1. STORYBOARD 5

4.1.2. Wireframe 5

1. INTRODUCTION

1.1. TOPIC

The topic of my hybrid project is a livestreaming application.

1.2. GOAL OF THE PROJECT

The goal of the project is to create a prototype, that lets the user to log in and start a livestreaming or join a livestream by the functionality provided in the app.

1.3. SCOPE AND CONSTRAINTS

The scope of the project is to create a prototype that means It is just an early version and that the app will not have all functionality, only main functionality.

The constrains of this project would be time. The lack of time to build an app alone in a few weeks is not an easy task.

2. USER STUDY

2.1. TARGETED USERS

Adults and teenagers who likes to watch events like music festivals and outdoor/indoor shows.

3. UX/UI STUDY

3.1. RESEARCH

3.1.1. MOBILE UX DESIGN KEY PRINCIPLES

1. **Cut out the clutter**

Don’t overload users with information. Every added button, image or line will make the interface more complicated. A simple rule is one primary action per screen.

2. **Make navigation self-evident**

.Helping people navigate is a high priority of an app. If people can’t find stuff your app is useless. Navigation must be coherent; you should use the right visuals so the navigation doesn’t need explaining. Navigation must be consistent for the app; Don’t move or hide navigation controls on different pages. Navigation should communicate the current location; the app should always indicate the current location.

3. **Create a seamless experience**

.You should not only think about mobile design but also how the app will look on different screens (laptop, tablet).

4. **Design finger-friendly tap-targets**

.Make sure tap-targets are big enough so they are easy to tap. Controls with a size of 7-10 mm can be accurately tapped with a finger. Also make sure there is anough space between tap targets.

5. **Text content should be legible**

.Text should be at least 11 points so it's legible at a typical viewing distance without zooming. Generous white space can make a page look more inviting and simple.

6. **Make interface elements clearly visible**

.Choose primary, secondary and accent colors for the app that support usability. Ensure enough color contrast so low vision users can use your app. Make sure there is enough contrast between text and background. Small text contrast ratio at least 4.5:1 against the background, large text at least 3:1. This applies on icons too.

7. **Design controls bases on hand position**

.Users only use one thumb for most of their phone. Place top level menu, frequently used controls, and common actions in the green zone. Place negative actions (delete or erase) in the red zone zo they can't be accidently tapped.

8. **Minimize need for typing**

.Typing is a slow and error-prone process. Remove unnecessary fields in forms. Use auto complete and personalized data.

9. **Test your design**

.Test the app with multiple users on different devices.

3.1.2. MOBILE UI DESIGN KEY PRINCILES

1. The Structure Principle
2. The architecture of the user interface should be purposeful and meaningful for the users.
3. The Simplicity Principle
4. Design should make tasks easy, communicate clearly in de users language and provide shortcuts.
5. The Visibility Principle
6. Design should make needed options and materials visible without distracting users with redundant information. Don't overwhelm and confuse users.
7. The Feedback Principle
8. Design should keep users informed about what is going on in a way the user understands.
9. The Tolerance Principle
10. Design should be flexible and tolerant. Allow mistakes by allowing undoing while preventing errors where is possible.
11. The Reuse Principle
12. Design should remember behavior from users to reuse. This way the user has to remember and think of less.
